

# SEPTIC CLASSIFIED AREAS

Linn County, OR

When one of our clients called us with an issue they were having on one of their industrial septic system designs, Pillar Consulting group was ready and able to assist. The inspector insisted that Classified Electrical Hazard areas must be addressed in the design of the septic system, well after completion of the design by another specialty septic system consulting firm and partial installation of the facility had already begun. Progress on the work was ceased, and the client needed answers. Pillar Consulting Group provided an orderly code and hazard review for the facility, and ultimately produced a detailed engineering study and drawings that clarified which portions of the facility should be treated as Class 1, Division 1, Division 2 or Unclassified areas. We understand that after our work was presented to the inspector that he commented something along the lines of “now that’s the way to do it and what I expect”. The project was completed successfully.
